PROJECT OVERVIEW

Toga started as a question: what would Greek life event coordination look like if it was actually designed? The app began as a personal concept born out of real frustration with how chapters manage RSVPs, headcount, and last-minute communication.

What shaped it most was an unlikely collaboration. A close friend studying finance became an essential working partner — someone who understood organizational structure, budget accountability, and chapter dynamics from a completely different lens. Regular working sessions pushed the design from a surface-level app into something that thought about real stakeholder needs: who owns the guest list, how does a treasurer track event spend, what does a chapter president actually need to see at a glance. That friction made the work sharper.

After completing the initial designs, the concept entered early conversations with investors interested in campus social infrastructure. Those conversations weren't about building immediately — they were about understanding what a real version of this would need to solve to earn adoption at scale. They confirmed the problem was real. The designs are what came out of that process.

DESIGN PROCESS

Phase 01

PROBLEM DEFINITION & DOMAIN RESEARCH

Toga is a concept prototype — five screens designed to high fidelity to explore what this product could be. The process was treated as if it were going to ship.

— Mapped the actual workflow chapters rely on: group chats, Google Forms, spreadsheets, verbal headcounts

— Collaborated closely with a finance major to understand the organizational and budgetary layer beneath the social one — event costs, chapter treasurer workflows, accountability structures

— Identified the core tension: Greek life is social but event management is logistical, and nothing was designed to bridge both

— Defined two user personas: the Chapter Organizer (oversight, accountability) and the Member (low-friction RSVP)

Phase 02

CONCEPT & INFORMATION ARCHITECTURE

— Mapped the full IA across four zones: Home Feed, Event Detail, RSVP Flow, and Chapter Dashboard

— Designed organizer and member flows separately before finding where they converged

— Built low-fidelity wireframes for all primary screens with speed of use as the primary constraint — college students won't tolerate friction

Phase 03

VISUAL DESIGN

— Developed a dark-base visual system with a warm accent — designed for the context where people actually use this: nighttime, at events, phones at low brightness

— Built the full component library in Figma: event cards, RSVP states, avatar stacks, bottom sheets, notification patterns

— Brought five screens to high fidelity: Home Feed, Event Detail, RSVP Confirmation, Chapter Dashboard, and Organizer View

Phase 04

CONCEPT VALIDATION

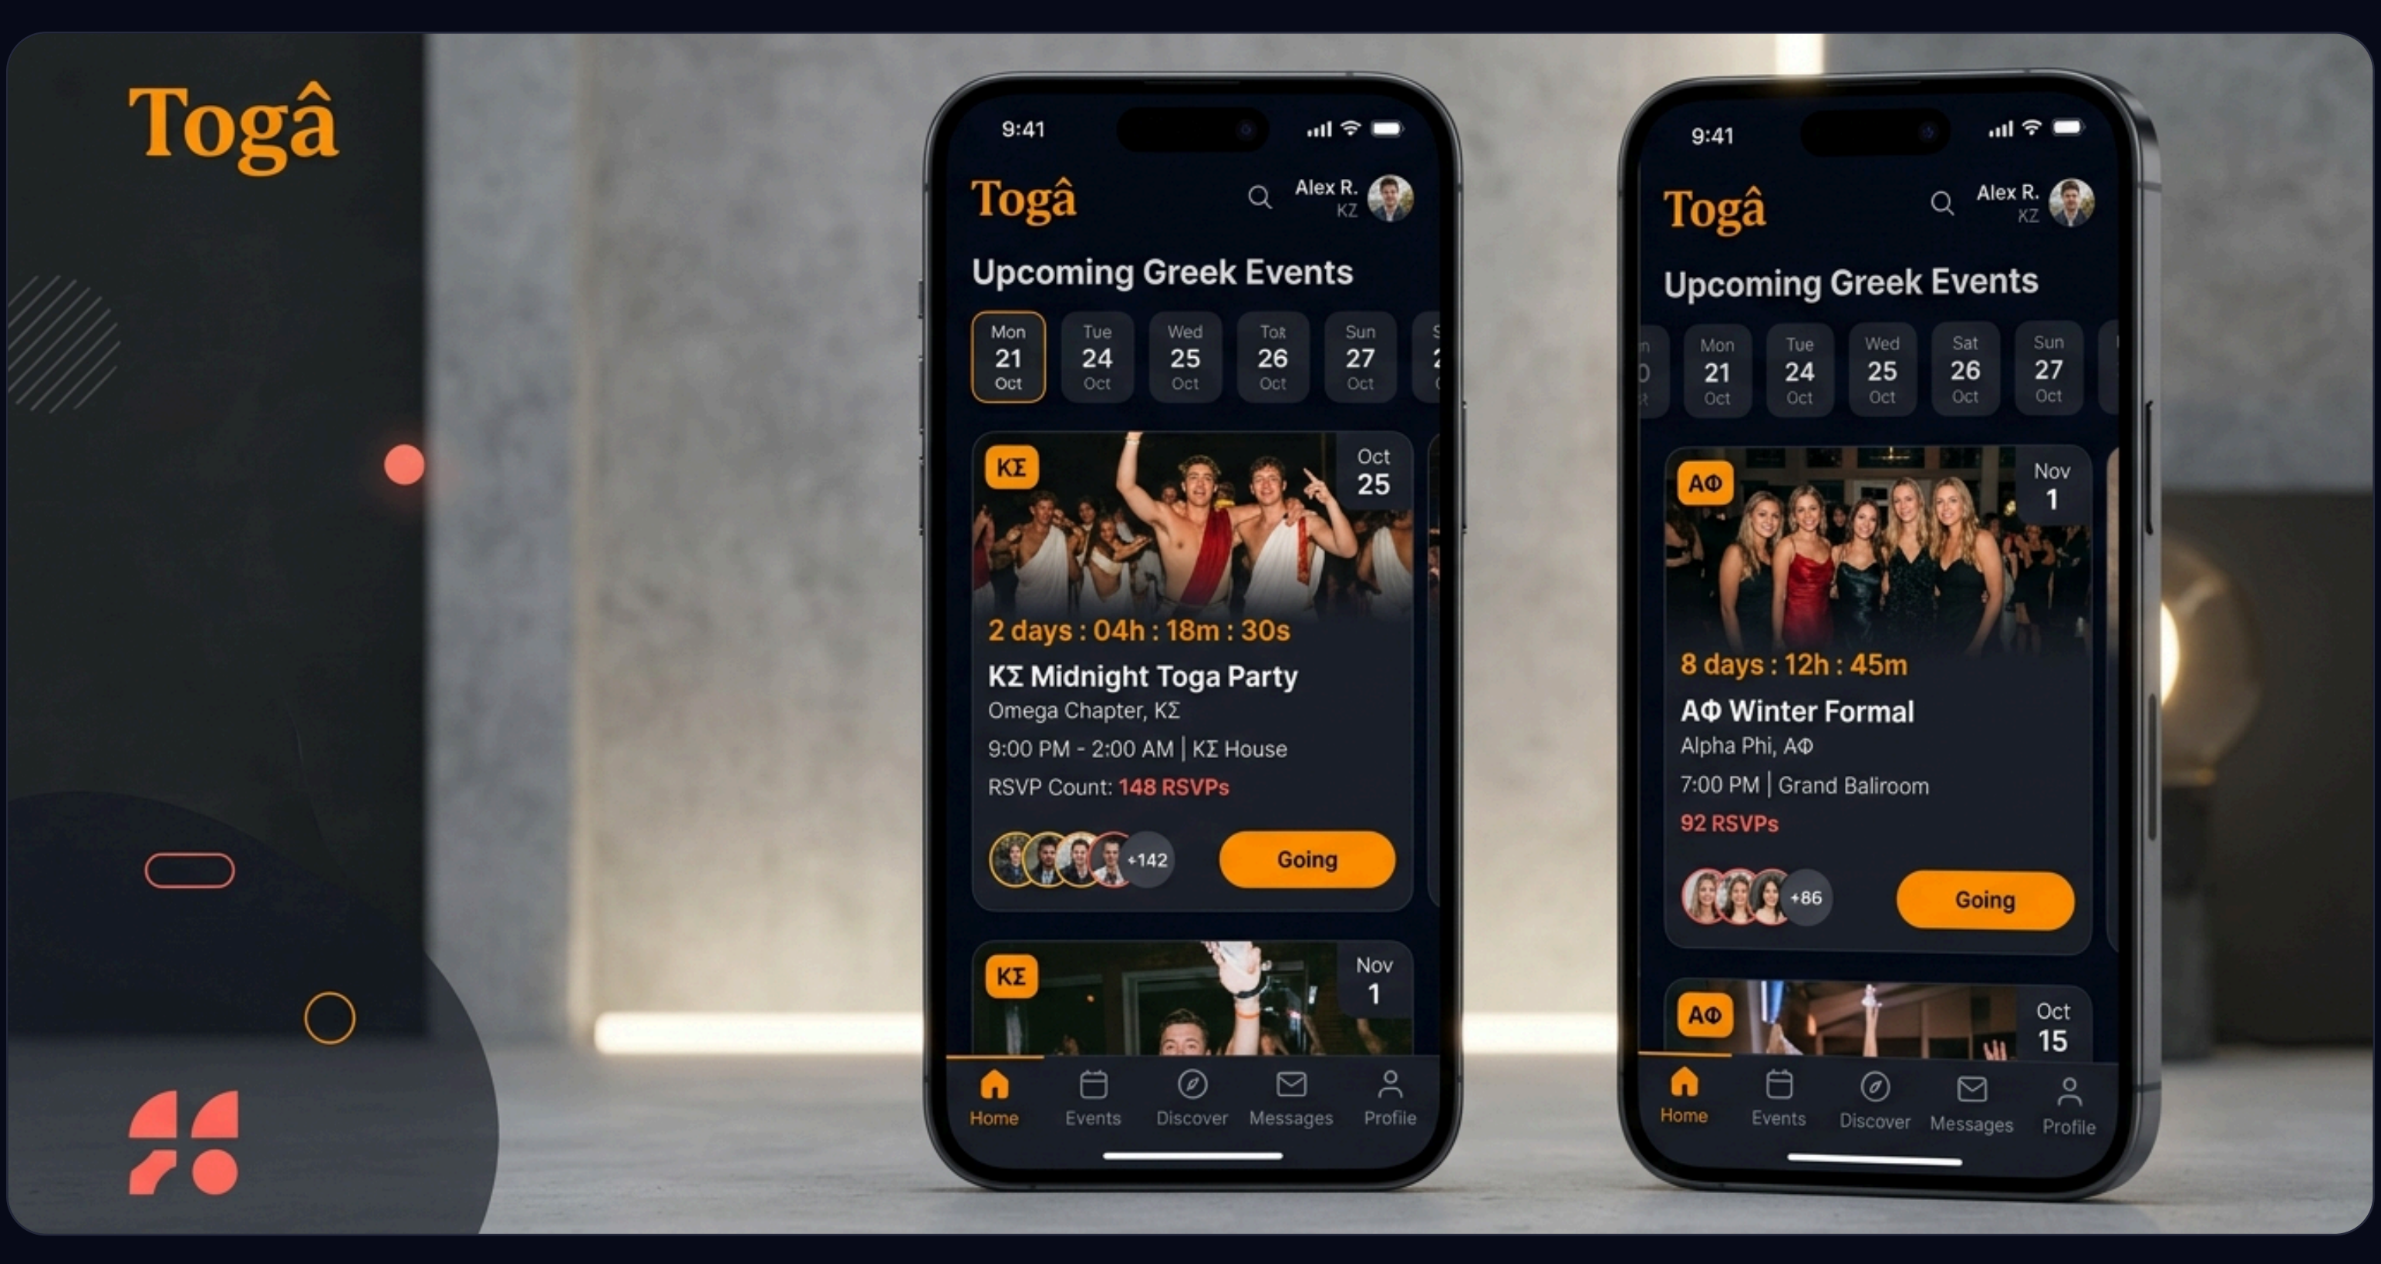
— Presented designs to Greek life members and chapter leadership for informal feedback

— Took the concept into early conversations with investors in the campus infrastructure space

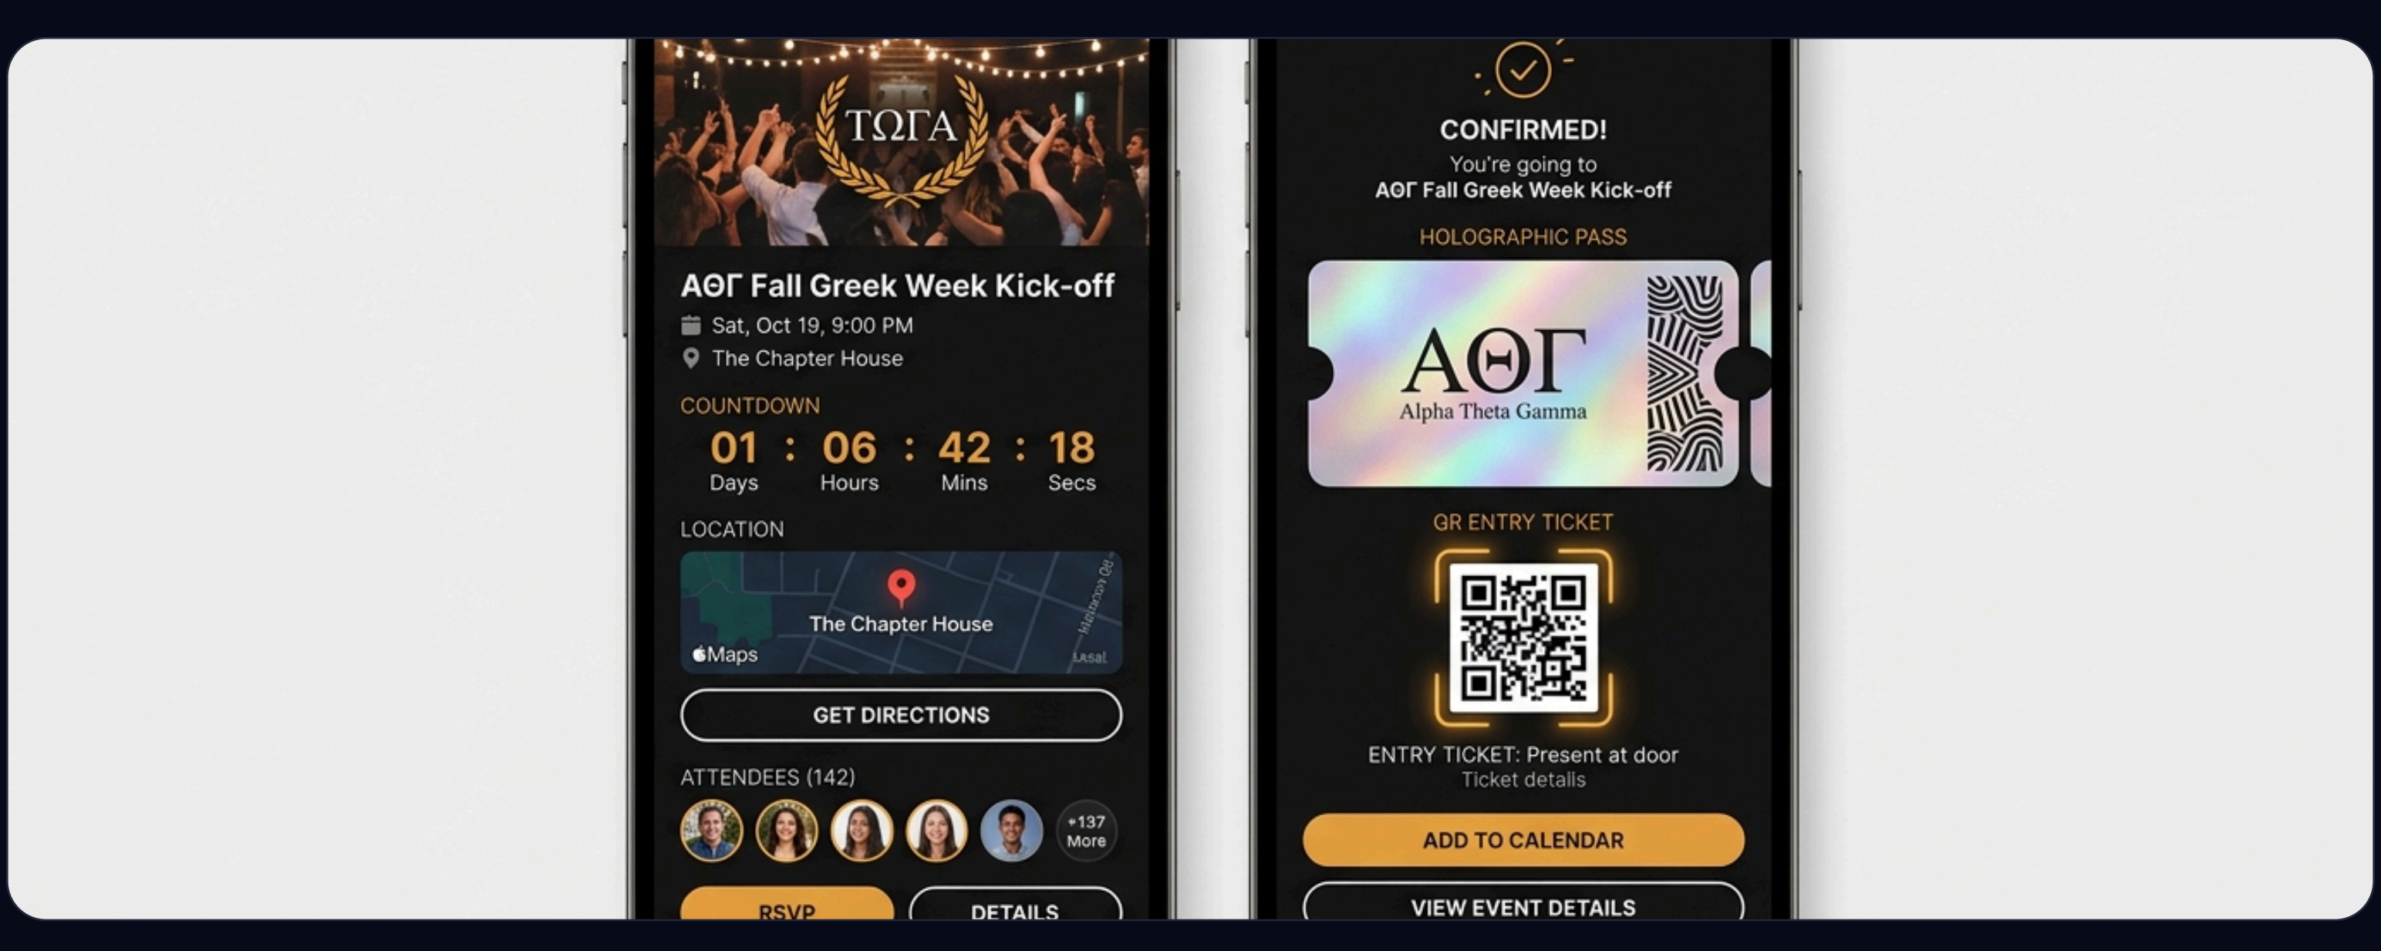
— Used that feedback to understand what the product would need to become — and to confirm the problem space was worth solving

---

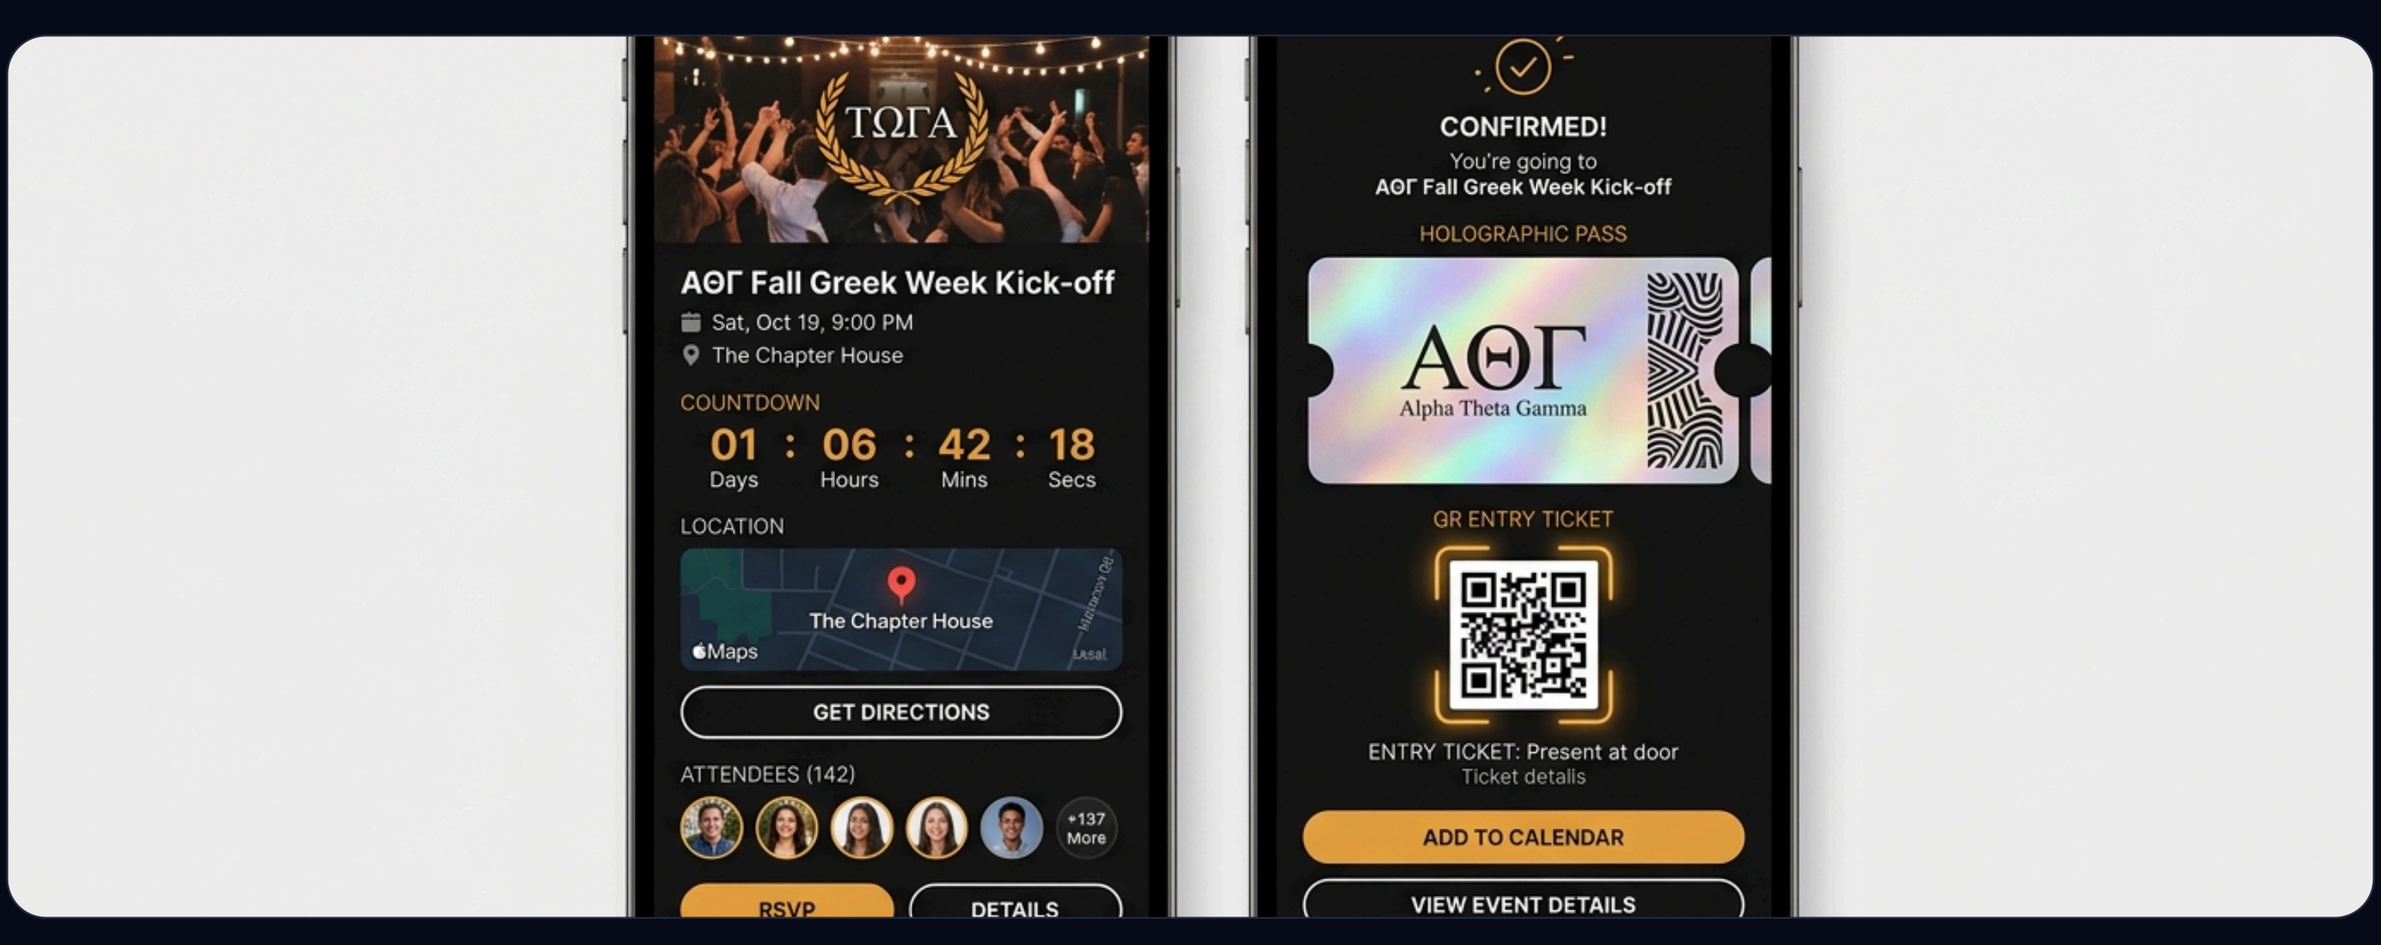
FINAL DELIVERABLES



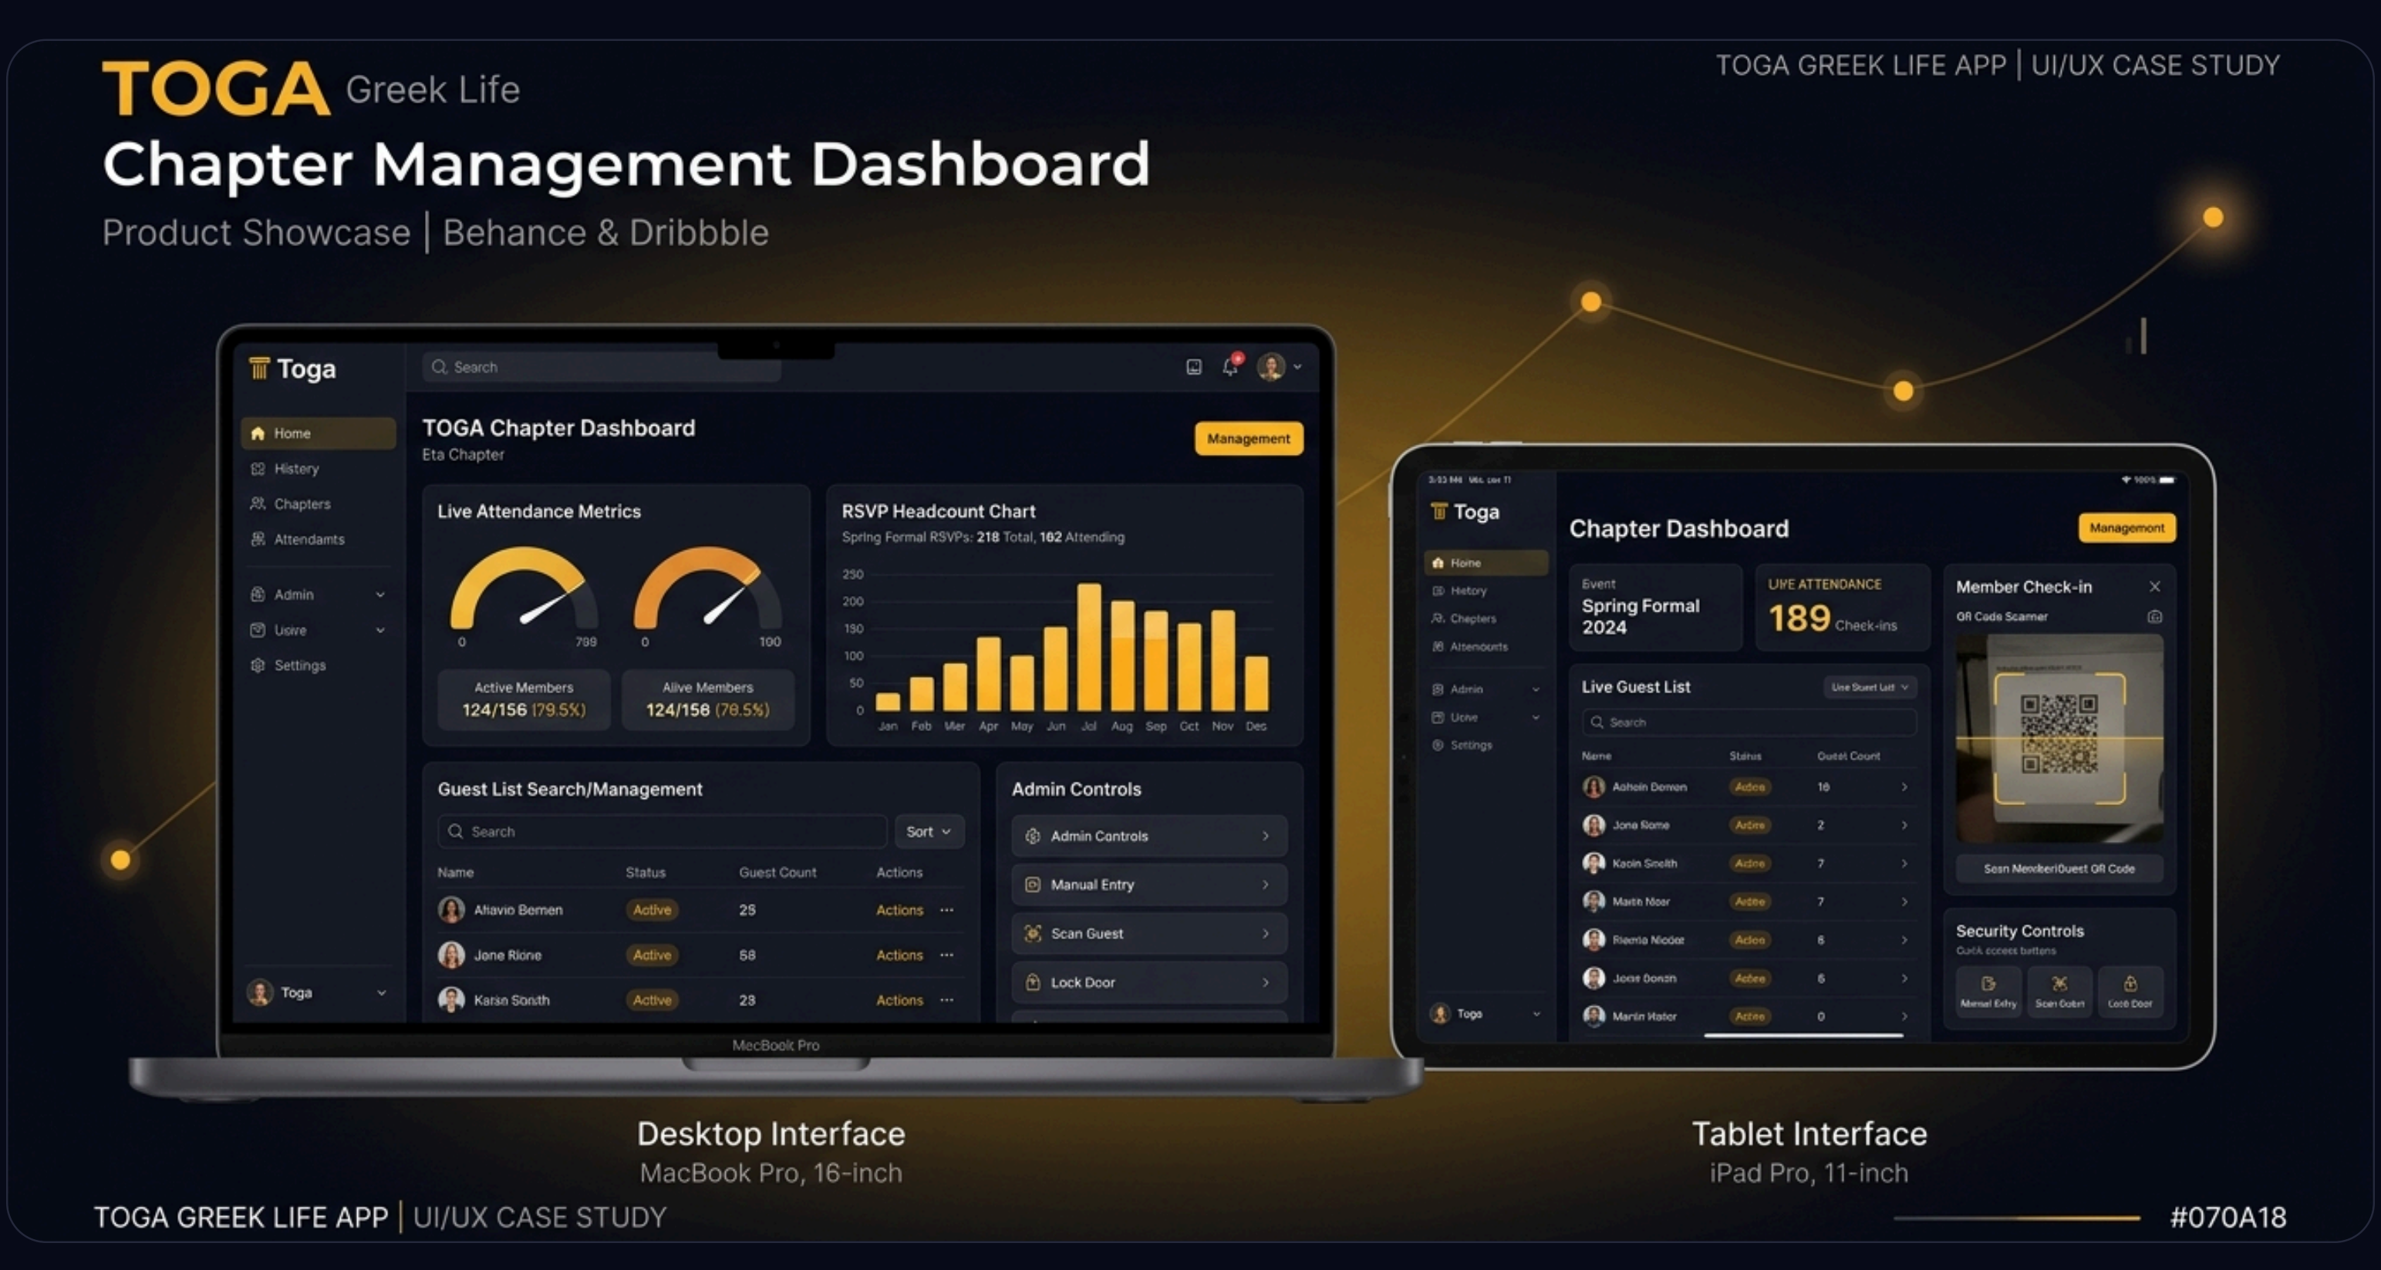
Home feed — event cards with RSVP count, chapter tags, and countdown timers



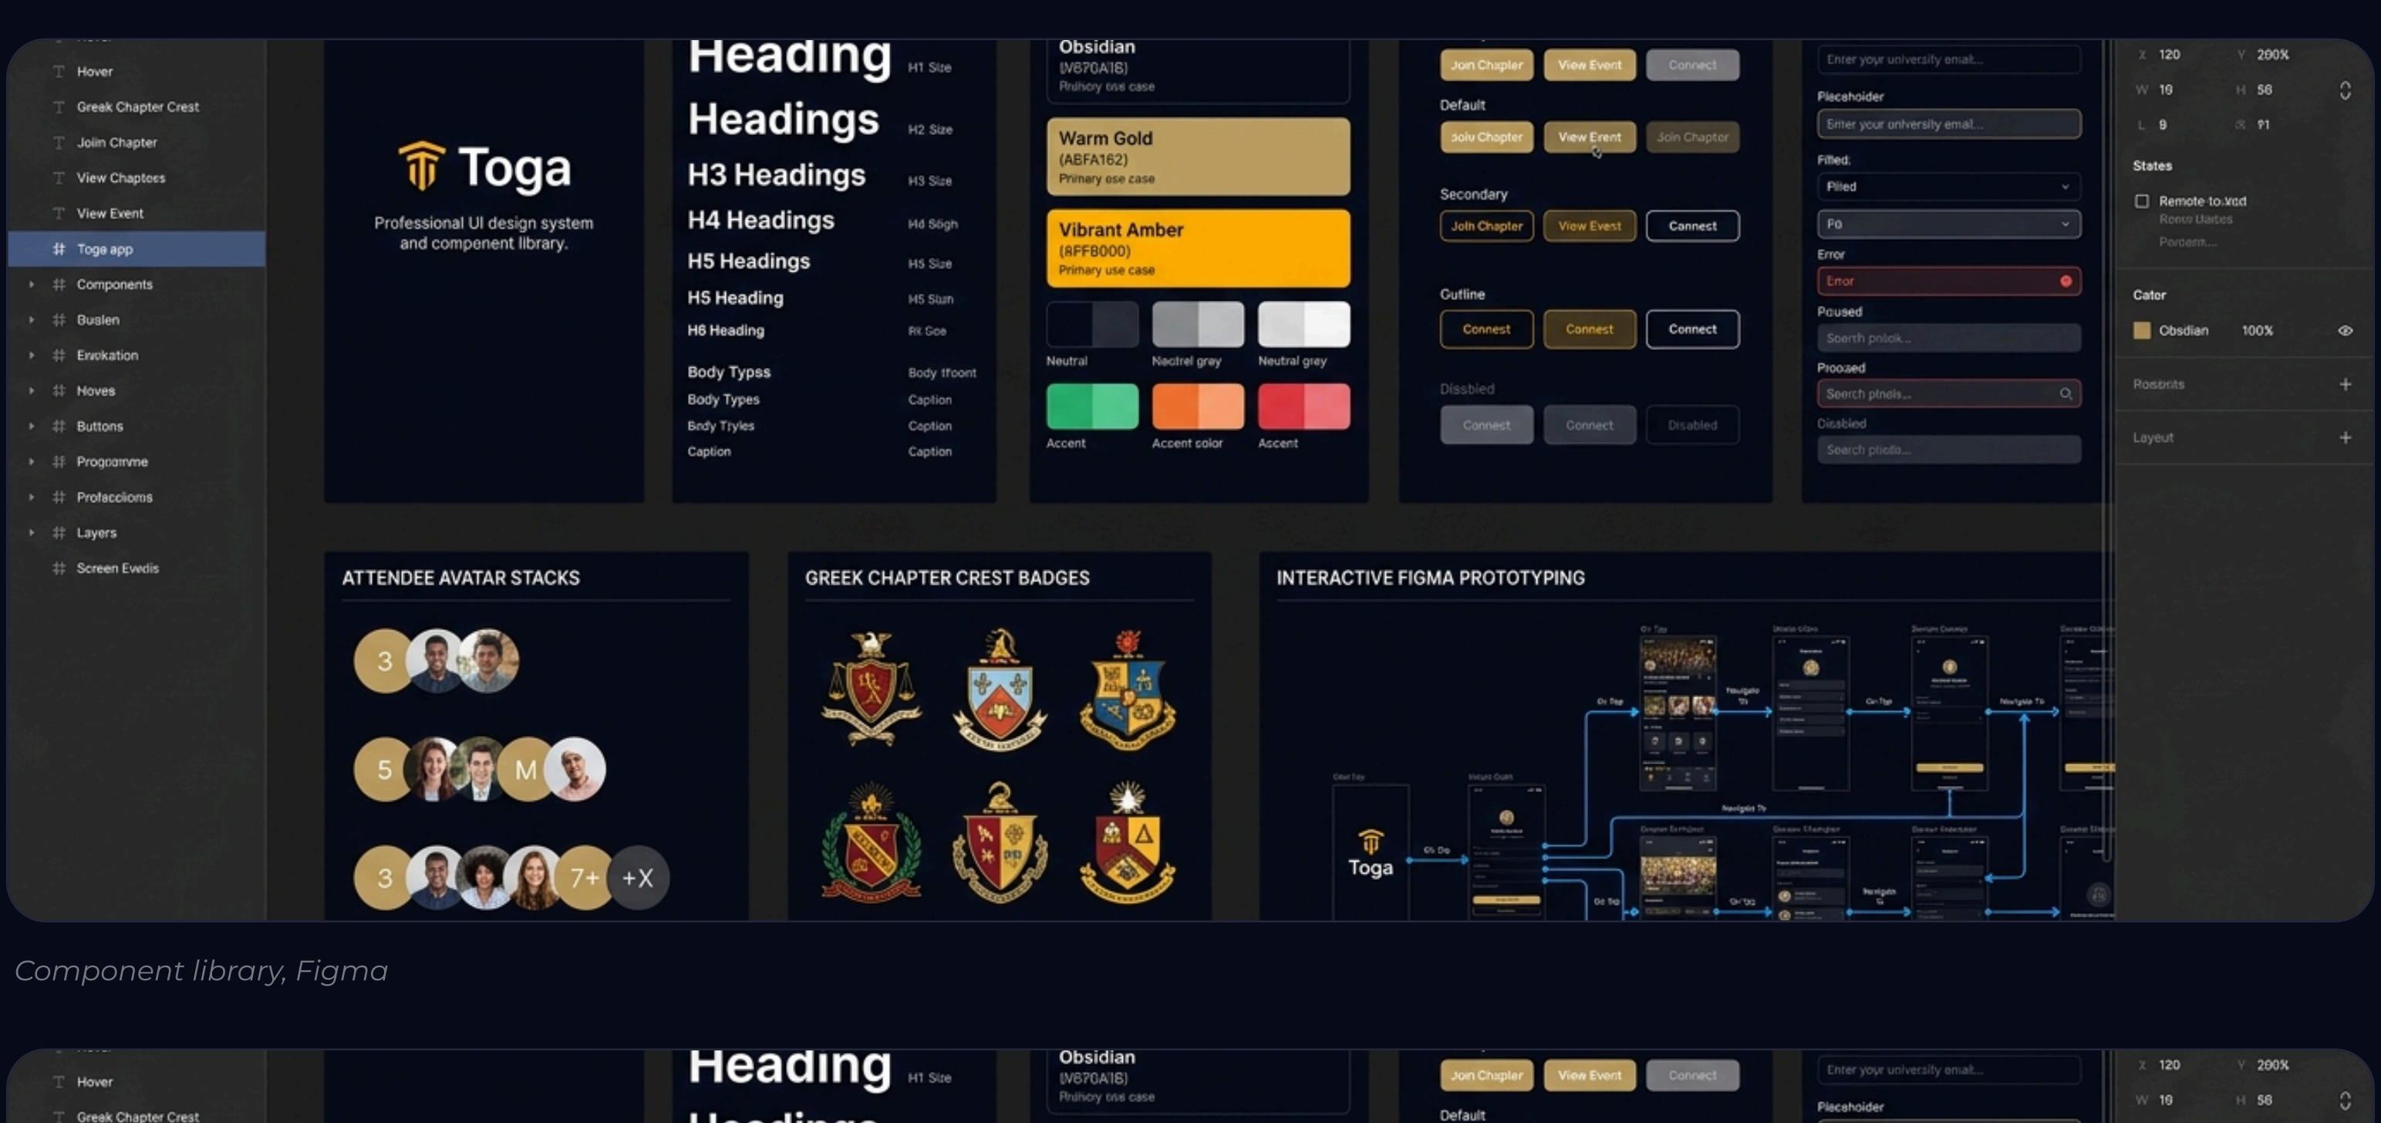
Event detail screen



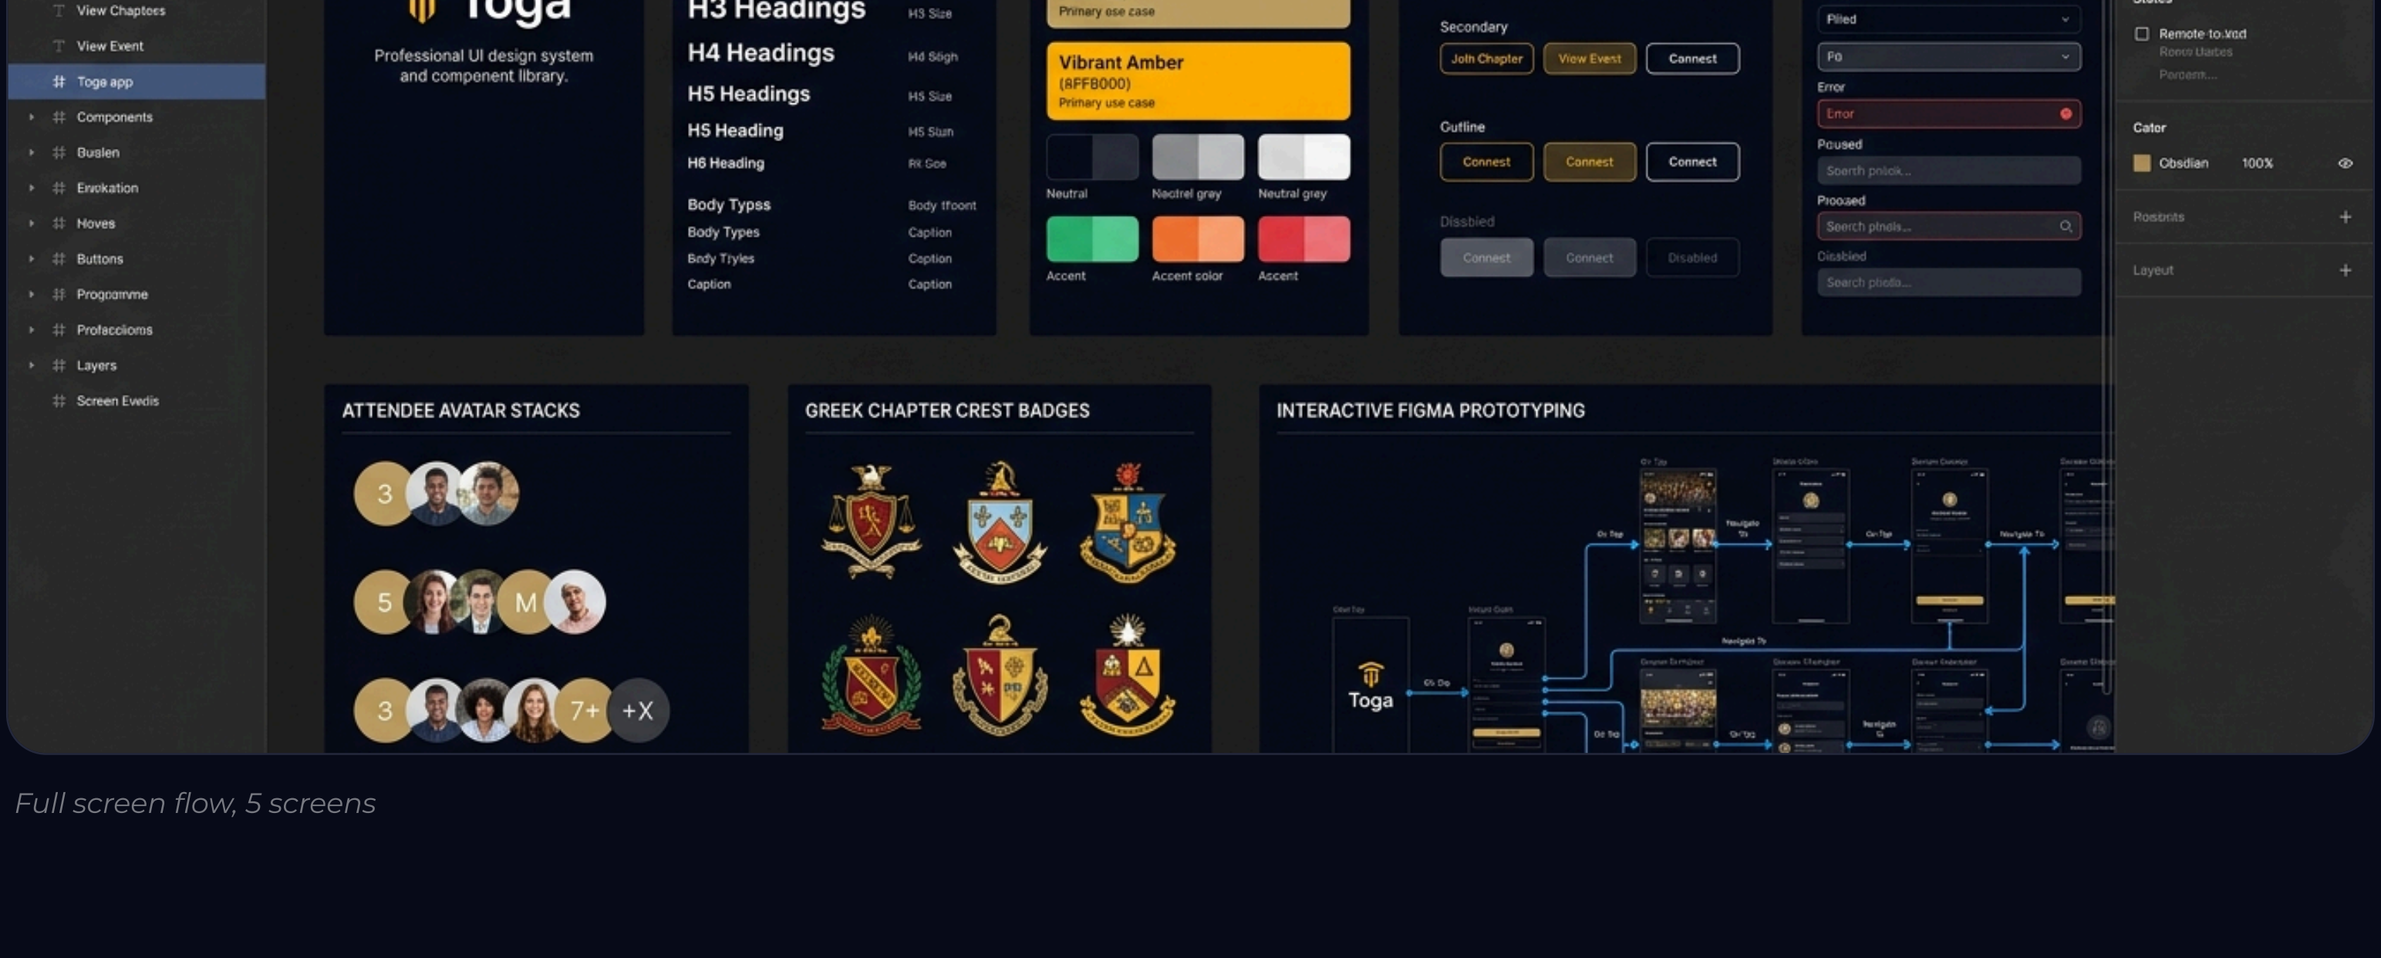
RSVP confirmation flow



Chapter dashboard — attendance tracking and organizer view



Component library, Figma



Full screen flow, 5 screens
